

Is it still alive?

Posted by zeljko_t - 2011/11/03 04:01

Hello,

I am looking for application virtualization product, which would allow me to run different versions of application server on the same machine (not necessarily at the same time) without conflicts.

Does this product allows that?

Is it still alive?

Best regards,
v
Zeljko

Just sent you a trial version, you can give it a play. It's 32-bit only.

We also released a very secure sandbox with VMLite 4.2 beta, basically, you can virtualize current running os, and run multiple instances of apps inside the vm. The performance is worse compared to application virtualization, but it's best separated from host. This new feature is called VMLite vm, you can create it from menu Machine > New VMLite...

Hello,

Is it possible to have a copy as well?

I remember when this thing was initially announced I got an e-mail saying that I'd get a copy when it came out for testing, but have gotten nothing as of yet.

A copy would be nice for testing

Regards,

there isn't significant change in last few months.

By the way, we also provide a secure sandbox from vmlite workstation v4, beta is available, that you can virtualize current running os, and sandbox all apps. It's slower, but still in very good performance. This is very secure, works on 32- and 64- bit systems.

New VMLite... from menu Machine to create one.

Why don't you give out any more copies, I believe its better than sandboxie.

You don't need to relies new versions, just allow users to download the old version.

Thanks Andrie
